1500

Porcelain Enamel Institute (PEI) Abrasion rating / Number of rotations

Anti-slip resistance – “barefoot”

Frost resistance

Rectified tiles. Rectification is a method of mechanical processing which consists in milling tile edges at a right angle to their surface. As a result, the elements obtained may be assembled without worrying about differences in size. In the rectification process tiles from the given batch all acquire the same size (with accuracy to 0.2 mm). This solution also allows to obtain even tile surface due to minimal joint thickness.

Tonal tiles – each tile is unique in comparison to the model tile. Tonal differences are likely to occur. Tiles are packed at random.
